COMPACTNESS RESULTS
FOR EVOLUTION EQUATIONS

RICCARDA ROSSI

in collaboration with GIUSEPPE SAVARÉ
Dipartimento di Matematica “F.Casorati”,
Università di Pavia.

COMPACTNESS IN L^p SPACES

$$\mathcal{U} \subset L^p(0, T; B),$$

B separable Banach space,

$$1 \leq p < \infty.$$

Problem: Find **necessary** and **sufficient** conditions for $\mathcal{U} \subset L^p(0, T; B)$ relatively **compact**.

Crucial issue for evolutionary PDEs: **compactness** method for **nonlinear evolution** equations [Lions'69, Lions-Magenes'72].

THE RIESZ-FRÉCHET-KOLMOGOROV CRITERION

B **finite** dimensional, $\{u_n\}$ bounded in $L^p(0, T; B)$.

$\{u_n\}$ is relatively compact in $L^p(0, T; B)$ **iff**

$$\limsup_{h \downarrow 0} \sup_{n \in \mathbb{N}} \int_0^{T-h} \|u_n(t+h) - u_n(t)\|_B^p dt = 0. \quad (\text{IEC})$$

(INTEGRAL EQUICONTINUITY CONDITION)

(IEC) holds if e.g. $\{u_n\}$ is bounded in $W^{1,p}(0, T; B)$.

When B is **infinite** dimensional,

(IEC) is **not sufficient** for L^p compactness!

\Rightarrow Need for a **compactness** condition **on the values** of $\{u_n\}$.

THE AUBIN-LIONS CONDITION

[Lions'61], [Aubin'63]: Let $\{u_n\} \subset L^p(0, T; B)$ fulfil (IEC) and
 \exists a Banach space $X \subset B$ with *compact injection* s.t.

$$\sup_{n \in \mathbb{N}} \int_0^T \|u_n(t)\|_X^p dt < +\infty. \quad (\text{SC1})$$

Then, $\{u_n\}$ is relatively compact in $L^p(0, T; B)$.

- We also have

$X \subset B$ with *compact injection*,

$B \subset Y$ with *continuous injection*.

$\Rightarrow L^p(0, T; X) \cap W^{1,p}(0, T; Y) \subset L^p(0, T; B)$ with compact injection.

SIMON'S INTEGRAL CHARACTERIZATION

[Simon'87]: $\{u_n\}$ is relatively compact in $L^p(0, T; B)$ **iff**
 $\{u_n\}$ fulfils (IEC) and

$$\left\{ \int_0^t u_n(s) ds : n \in \mathbb{N} \right\}$$

is relatively compact in $B \quad \forall t \in (0, T)$. (SC2)

Proof: approximation by convolution + Ascoli-Arzelà's compactness theorem.

COMPACTNESS IN TIME AND COMPACTNESS IN SPACE

Two main **ingredients** in these **compactness** criteria:

- **Compactness in time:** via the **INTEGRAL EQUICONTINUITY CONDITION**;
 - **Compactness in space:** (when B is not finite dimensional) a compactness condition
 - (SC1): on the values of $\{u_n\}$, ([A., L.], only **sufficient**)
 - (SC2): on the **time integrals** of $\{u_n\}$, ([S.], **necessary & sufficient**).
- (SC2) is **weaker** than (SC1); (SC1) is **easier** to handle in the applications.

MAIN ISSUES

- **Necessity:** Is the Aubin-Lions condition necessary?
- **Generalizations:**
 - of the **Aubin-Lions** condition:

$$\sup_{n \in \mathbb{N}} \int_0^T \|u_n(t)\|_X dt < +\infty \quad \rightsquigarrow \quad \sup_{n \in \mathbb{N}} \int_0^T \mathcal{F}(u_n(t)) dt < +\infty?$$

for a suitable functional \mathcal{F}

- of the **integral equicontinuity** condition: e.g., replace

$$\|\cdot\|_B \quad \rightsquigarrow \quad d_B(\cdot, \cdot)?$$

(when (B, d_B) is a complete, separable, **metric** space only).

FROM L^p COMPACTNESS TO COMPACTNESS IN MEASURE

Definitions:

- $\{u_n\}, u \in \mathcal{M}(0, T; B)$ ($\mathcal{M}(0, T; B) =$ (strongly) measurable B -valued functions).

$u_n \rightarrow u$ **in measure** iff

$$\lim_{n \uparrow +\infty} |\{t \in (0, T) : \|u_n(t) - u(t)\|_B \geq \sigma\}| = 0 \quad \forall \sigma > 0,$$

($|\cdot|$ denotes the Lebesgue measure).

- $\{u_n\} \subset L^p(0, T; B)$ is **p-uniformly integrable** iff

$$\lim_{|J| \downarrow 0} \sup_{n \in \mathbb{N}} \int_J \|u_n(t)\|_B^p dt = 0.$$

FROM L^p COMPACTNESS
TO COMPACTNESS IN MEASURE

Fact 1: Let $\{u_n\}$ fulfil the **integral equicontinuity condition**.

Then,

$\{u_n\}$ is **p-uniformly integrable**.

Fact 2: Let $\{u_n\} \subset L^p(0, T; B)$ be **p-uniformly integrable**.

Then,

$\{u_n\}$ is relatively compact in $L^p(0, T; B)$ iff

$\{u_n\}$ is relatively compact **in measure**.

Supposing (IEC), we **turn to compactness in measure!!**

PLAN OF THE TALK

- ◇ Generalization of the **Aubin-Lions compactness in space** condition \rightsquigarrow the **tightness** condition \rightsquigarrow adopt a **probabilistic point of view**
- ◇ the **Young measures** approach
- ◇ the fundamental **compactness result** of **Young measures** theory
- ◇ **criterion** for compactness in **measure**
- ◇ **criterion** for L^p **compactness**

THE TIGHTNESS CONDITION

space compactness condition (SC1) \rightsquigarrow tightness condition

$$\sup_{n \in \mathbb{N}} \int_0^T \mathcal{F}(t, u_n(t)) dt < +\infty,$$

with $\mathcal{F} : (0, T) \times B \rightarrow [0, +\infty]$ measurable, s.t. for a.e. $t \in (0, T)$

$v \mapsto \mathcal{F}_t(v) := \mathcal{F}(t, v)$ is **l.s.c.**

$\{v \in B : \mathcal{F}_t(v) \leq c\}$ are **compact** for any $c \geq 0$

i.e., \mathcal{F} is a **normal coercive integrand** on $(0, T) \times B$.

Example: the Aubin-Lions condition. $X \subset B$ compactly,

$$\mathcal{F}(t, v) := \begin{cases} \|v\|_X^p & v \in X, \\ +\infty & \text{otherwise,} \end{cases} \quad 1 \leq p < \infty.$$

PARAMETRIZED (YOUNG) MEASURES

Definition A parametrized (Young) measure $\nu := \{\nu_t\}_{t \in (0, T)}$ is family of probability measures ν_t on B s.t.

$$t \in (0, T) \mapsto \int_B \phi(\xi) d\nu_t(\xi) \text{ is measurable } \forall \phi \in C^b(B),$$

$C^b(B)$ the space of continuous and bounded functions on B .

We denote by $\mathcal{Y}(0, T; B)$ the set of Young measures.

Fubini's Theorem: For $\nu = \{\nu_t\}_{t \in (0, T)} \in \mathcal{Y}(0, T; B) \exists!$ **measure** ν on $(0, T) \times B$ s.t. for every measurable $\varphi : (0, T) \times B \rightarrow [0, +\infty]$

$$t \in (0, T) \mapsto \int_B \varphi(t, \xi) d\nu_t(\xi) \text{ is measurable,}$$

$$\int_{(0, T) \times B} \varphi(t, \xi) d\nu(t, \xi) = \int_0^T \left(\int_B \varphi(t, \xi) d\nu_t(\xi) \right) dt.$$

YOUNG MEASURE ASSOCIATED TO A FUNCTION

To $u \in \mathcal{M}(0, T; B)$ we associate a Young measure $\nu = \{\nu_t\}_{t \in (0, T)}$ by $\nu_t := \delta_{u(t)}$ for a.e. $t \in (0, T)$, i.e.,

$$\nu(A) = \int_0^T \delta_{u(t)}(A_t) dt \quad \forall A \subset (0, T) \times B, \quad A_t := \{\xi \in B : (t, \xi) \in A\}.$$

ν is the **measure carried by the graph** of u .

Conversely, $\nu \in \mathcal{Y}(0, T; B)$ is **associated** to a **function** if the **support** of ν_t is a **singleton** for a.e. $t \in (0, T)$.

NARROW CONVERGENCE OF YOUNG MEASURES

Definition Let $\{\nu_n\}, \nu \in \mathcal{Y}(0, T; B)$: ν_n **narrowly converges** to ν ($\nu \Rightarrow \nu$) iff $\forall \varphi \in C^b((0, T) \times B)$

$$\lim_{n \uparrow +\infty} \int_{(0, T) \times B} \varphi(t, \xi) d\nu^n(t, \xi) = \int_{(0, T) \times B} \varphi(t, \xi) d\nu(t, \xi).$$

Link with the convergence in measure: Let $\{u_n\}, u \in \mathcal{M}(0, T; B)$ and $\{\nu_n\}, \nu \in \mathcal{Y}(0, T; B)$, with $\nu_t^n = \delta_{u_n(t)}, \nu_t = \delta_{u(t)}$ for a.e. $t \in (0, T)$. Then,

$$u_n \rightarrow u \quad \text{in measure} \quad \Leftrightarrow \quad \nu_n \Rightarrow \nu \quad \text{narrowly}$$

Crucial Fact: If $u_n \leftrightarrow \nu_n = \{\delta_{u_n(t)}\}_{t \in (0, T)}$ and $u_n \Rightarrow \mu$ (i.e., $\nu_n \Rightarrow \mu$), then

$\{u_n\}$ **converges in measure iff** μ_t is a **Dirac mass** for a.e. $t \in (0, T)$.

COMPACTNESS FOR YOUNG MEASURES

Theorem [Balder, 1984]

Let $\{u_n\} \in \mathcal{M}(0, T; B)$ be
a **tight** sequence

w.r.t. a normal coercive integrand \mathcal{F} .

Then, there exists a **subsequence** u_{n_k} and
a **parametrized measure** $\mu = \{\mu_t\}_{t \in (0, T)} \in \mathcal{Y}(0, T; B)$,
such that

$$u_{n_k} \Rightarrow \mu \quad \text{as } k \uparrow \infty.$$

BACK TO COMPACTNESS IN MEASURE

- Replace the Aubin-Lions **space compactness condition** by the **tightness condition** (for a normal coercive integrand \mathcal{F})

$$\sup_{n \in \mathbb{N}} \int_0^T \mathcal{F}(t, u_n(t)) dt < +\infty.$$

- By BALDER'S theorem,

$$\exists \mu = \{\mu_t\}_{t \in (0, T)} \in \mathcal{Y}(0, T; B) \quad \text{s.t.} \quad u_{n_k} \Rightarrow \mu \quad \text{as } k \uparrow \infty.$$

- It is **sufficient** to show that μ_t is **concentrated**, i.e.

$$\mu_t = \delta_{u(t)} \quad \text{for a.e. } t \in (0, T),$$

in order to **conclude**

$$u_{n_k} \rightarrow u \quad \text{in measure as } k \uparrow \infty.$$

INTEGRAL EQUICONTINUITY \Rightarrow CONCENTRATION

Technical passage: If

$$\limsup_{h \downarrow 0} \sup_{n \in \mathbb{N}} \int_0^{T-h} \|u_n(t+h) - u_n(t)\|_B^p dt = 0,$$

then, passing to the limit with Young measures,

$$\int_0^T \left(\iint_{B \times B} \|v - w\|_B d\mu_t(v) d\mu_t(w) \right) dt = 0,$$

whence

$$\|v - w\|_B = 0 \quad \text{for } \mu_t \otimes \mu_t\text{-a.e. } (v, w) \in B \times B.$$

$$\Rightarrow \mu_t \text{ is a Dirac mass for a.e. } t \in (0, T).$$

A NEW CONCENTRATION CONDITION

It is possible to replace (IEC) by the

WEAK INTEGRAL EQUICONTINUITY CONDITION

$$\limsup_{h \downarrow 0} \sup_{n \in \mathbb{N}} \int_0^{T-h} g(u_n(t+h), u_n(t)) dt = 0,$$

$g : B \times B \rightarrow [0, +\infty]$, is **lower semicontinuous** and (LSC)

g is **compatible with** \mathcal{F} (of the tightness cond.), i.e.

$$u, v \in D(\mathcal{F}_t), g(u, v) = 0 \quad \Rightarrow \quad u = v \quad (\text{COMP})$$

with $D(\mathcal{F}_t) := \{v \in B : \mathcal{F}(t, v) < +\infty\}$ for a.e. $t \in (0, T)$.

Metric extension of (IEC): $g(u, v) := d_B(u, v) \quad \forall (u, v) \in B \times B$.

WEAK INTEGRAL EQUICONTINUITY

Let us gain **further insight** into

$$\lim_{h \downarrow 0} \sup_{n \in \mathbb{N}} \int_0^{T-h} g(u_n(t+h), u_n(t)) dt = 0. \quad (\text{WIEC})$$

- The **lower-semicontinuity** (LSC) of g allows to **pass to the limit with Young measures** and obtain

$$\int_0^T \left(\iint_{B \times B} g(v, w) d\mu_t(v) d\mu_t(w) \right) = 0.$$

- Thanks to the **compatibility condition** (COMP),

$$\begin{aligned} g(v, w) &= 0 \quad \text{for } \mu_t \otimes \mu_t\text{-a.e. } (v, w) \in B \times B \\ \Rightarrow \quad \mu_t &\text{ is a } \mathbf{Dirac mass} \text{ for a.e. } t \in (0, T). \end{aligned}$$

OUR CRITERION FOR COMPACTNESS IN MEASURE

Theorem 1 “Compactness in measure=tightness + W.I.E.C.”
[R., Savaré (Ann. Sc. Norm. Sup. Pisa Cl. Sci. 2003)]

Sufficiency: Let $\{u_n\} \subset \mathcal{M}(0, T; B)$ such that

$\{u_n\}$ is **tight**,
 $\{u_n\}$ fulfils **(WIEC)**.

Then,

$\{u_n\}$ is **relatively compact** in $\mathcal{M}(0, T; B)$.

Necessity: Conversely, if $\{u_n\}$ is relatively compact in measure, then $\{u_n\}$ is tight w.r.t. a normal coercive integrand \mathcal{F} independent of the variable t and **(WIEC)** holds for any bounded continuous (semi-)distance g on B .

OUR CRITERION FOR L^p COMPACTNESS

Theorem 2 “ L^p compactness=integral equicontinuity +tightness” [R., Savaré (Ann. Sc. Norm. Sup. Pisa Cl. Sci. 2003)]

A bounded sequence $\{u_n\}$ in $L^p(0, T; B)$
is **relatively compact** iff

$\{u_n\}$ is **tight** w.r.t. a normal coercive integrand \mathcal{F} and

$$\limsup_{h \downarrow 0} \sup_{n \in \mathbb{N}} \int_0^{T-h} \|u_n(t+h) - u_n(t)\|_B^p dt = 0.$$

Converse of the Aubin-Lions theorem. If $\{u_n\}$ is relatively compact in $L^p(0, T; B)$, there exists $X \subset B$ **compactly** s. t.

$$\sup_{n \in \mathbb{N}} \int_0^T \|u_n(t)\|_X^p dt < +\infty.$$

REMARKS

- **Extension** of Thms. 1 and 2 to B -valued functions defined on a **bounded domain** $\Omega \subset \mathbb{R}^d$, $d \geq 1$.
- Theorem 1 is of **metric nature** and still holds if

$$(B, \|\cdot\|_B) \rightsquigarrow (B, d_B).$$

- **Extension** of Theorem 1 to **weak topologies**: $\{u_n\} \in \mathcal{M}(0, T; B)$ weakly converges in measure to u iff

$${}_{B'}\langle f, u_n \rangle_B \rightarrow {}_{B'}\langle f, u \rangle_B \quad \text{in measure} \quad \forall f \in B'.$$

- Allowing for a **time-dependent** integrand \mathcal{F} in the **tightness** condition opens to non-trivial applications of Theorems 1 and 2 to **evolutionary** PDEs (e.g., extend a compactness result of LUCKHAUS, VISINTIN for the **Stefan Problem** with the Gibbs-Thomson law).
